

Configured Things showcasing Smart Space technology at Ashton Gate Stadium, July 25-26th 2018

Configured Things, a Bristol-based Smart Spaces Smart Service start-up, invite you to view demonstrations and discuss our approach to managing the challenge of owning, operating and gaining value from IT and IoT systems in environments with shared responsibilities and dynamic requirements.

Organisations working together, building Smarter Systems

We believe we hold a unique perspective of configuration for front-to-back management of servers, networks, displays and web browsers for the intelligent control of areas such as smart spaces (e.g. stadia, airports, smart cities), cyber security and network providers.

See a Smart Space in action

Configured Things will be demonstrating and describing its front-end web compositing tool, WebWindows, that simplifies the operations of systems and associated content and the management of associated backend systems. In addition, Stadia-specific Smart Space IoT demonstrations will be presented for a preview into the potential offered by a configuration management approach towards the application layer.

If you are involved in Smart Spaces, building solutions across organisational boundaries or looking at security management then we would like to invite you to meet us during this event.
